

PREFORMED WINDOW TREATMENT

ABSTRACT

The present invention provides a scalable, preformed, mold covered with fabric to form a window treatment. The fabric is cut to fit the mold and adhered to its contours in order to obtain the shape of the desired window treatment. The fabric can also have alignment tabs in order to make attachment to the mold easier. One or more rod hooks can be adhered to the fabric covering the mold or integrated into the mold. The rod hook attaches the window treatment to any standard curtain rod. Optional side extensions allow the creation of fuller pieces. The mold is designed to look attractive on the underside as well as the top side (front – back).
